

8th Senior Disaster Management Officials Forum

Beijing, China

Aug. 11~12, 2014

Scenario Simulation and Engineering Solution for Extreme Disasters

Xinzheng Lu

Institute of Disaster Prevention and Mitigation

Department of Civil Engineering

Tsinghua University, Beijing, China

Extreme disasters

not considered in conventional design

Very low occurrence possibility

Very severe consequences

Lack of knowledge

Must be prepared for

■ Challenges

Mega-structures
– never constructed
in human history

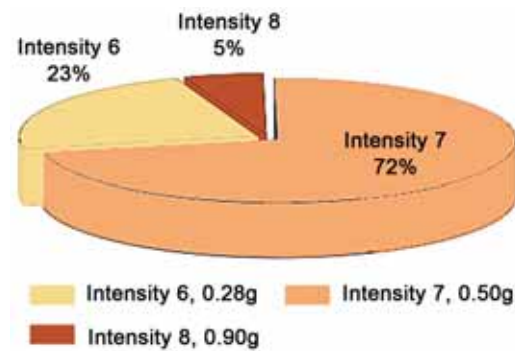

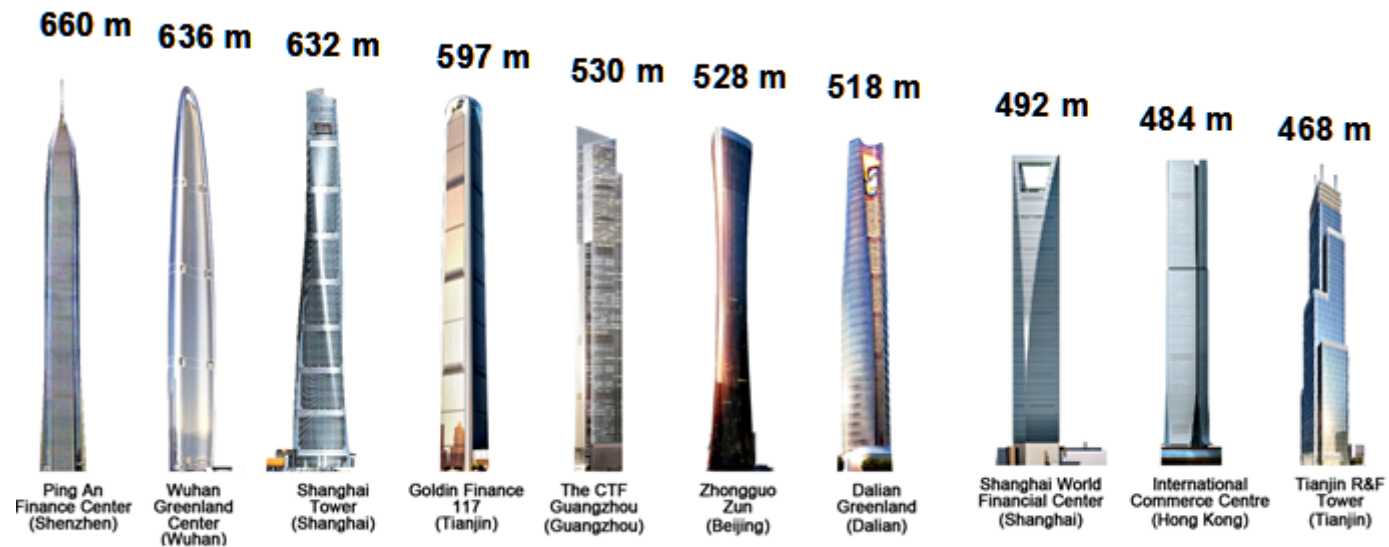

How can we prepare for
something we do not
understand?

Extreme disasters
– never happened
in human history

different disciplines
– understood by
non-professional

Introductions

■ Typical super-tall buildings in China

Earthquakes? I'm also afraid!

Distribution of super-tall buildings (>300m) in China

Introductions

- Extreme disasters

1679, M8.0 Earthquake
in Beijing

Introductions

Scenario simulation

From Micro-scale
to Macro-scale

Engineering solution

Typical examples

Super-tall buildings

Scenario simulation

Large-span bridges

Engineering solution

High-speed railway station

Numerical model

Experimental validation

Engineering solution

Nuclear power plant

Design of the tallest building in Beijing

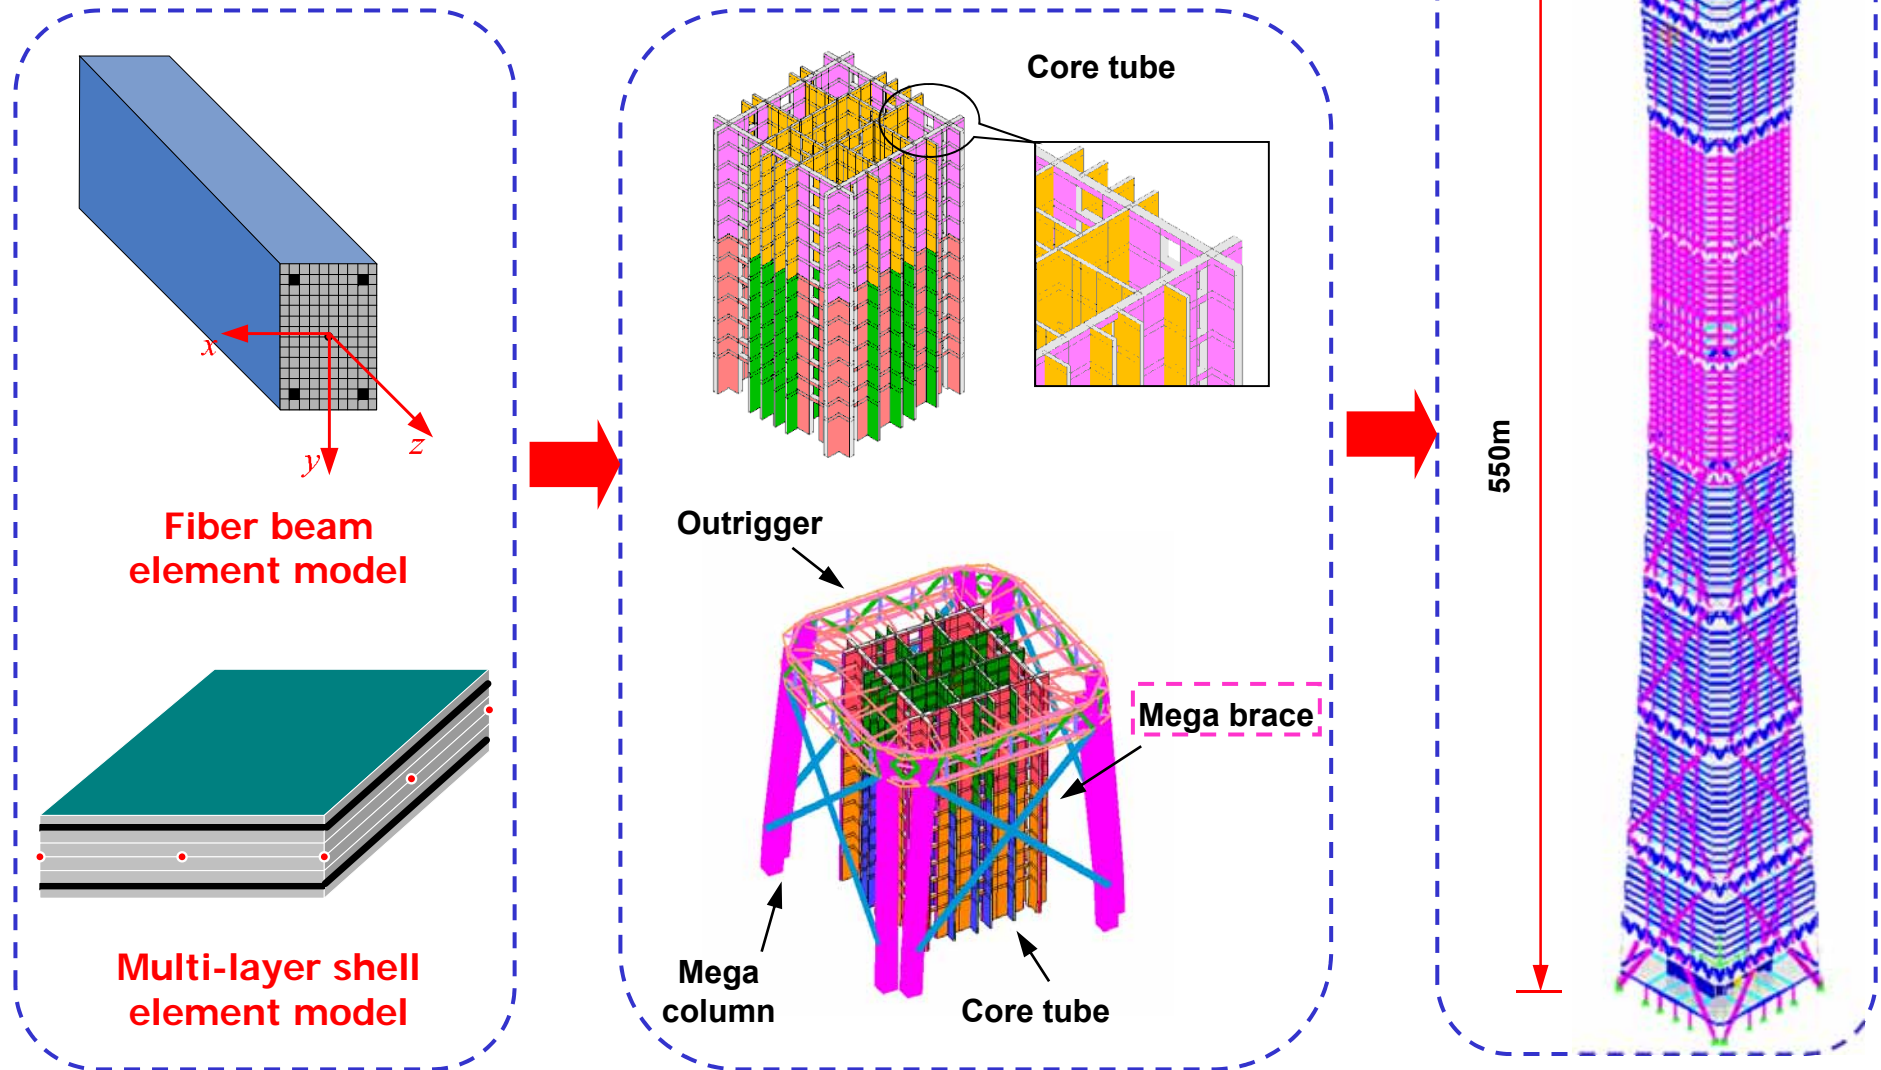

Z15 (Chinese Cup)

- Height > 500m
- Seismic intensity 8
- Tallest building in such intensity

Design of the tallest building in Beijing

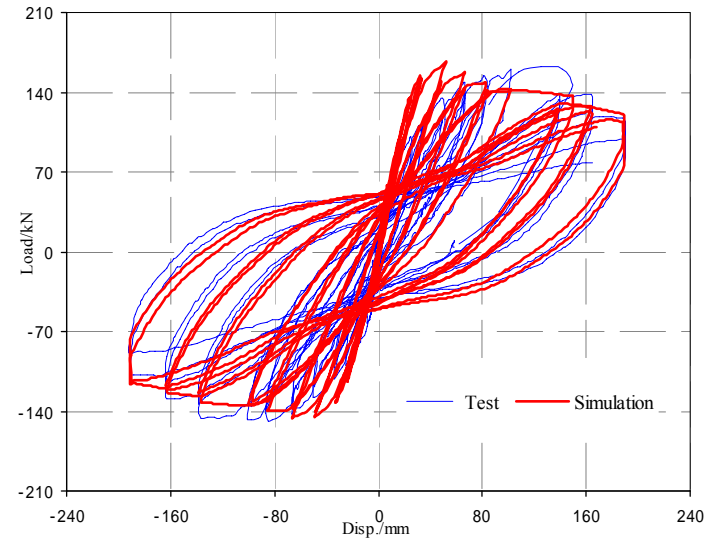

■ Numerical model

Design of the tallest building in Beijing

■ Experimental validation

Design of the tallest building in Beijing

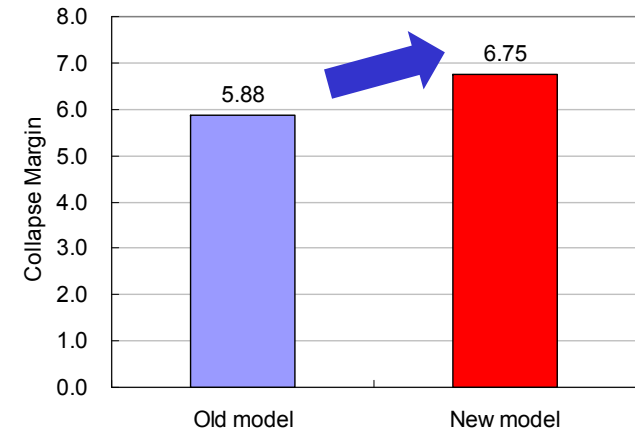

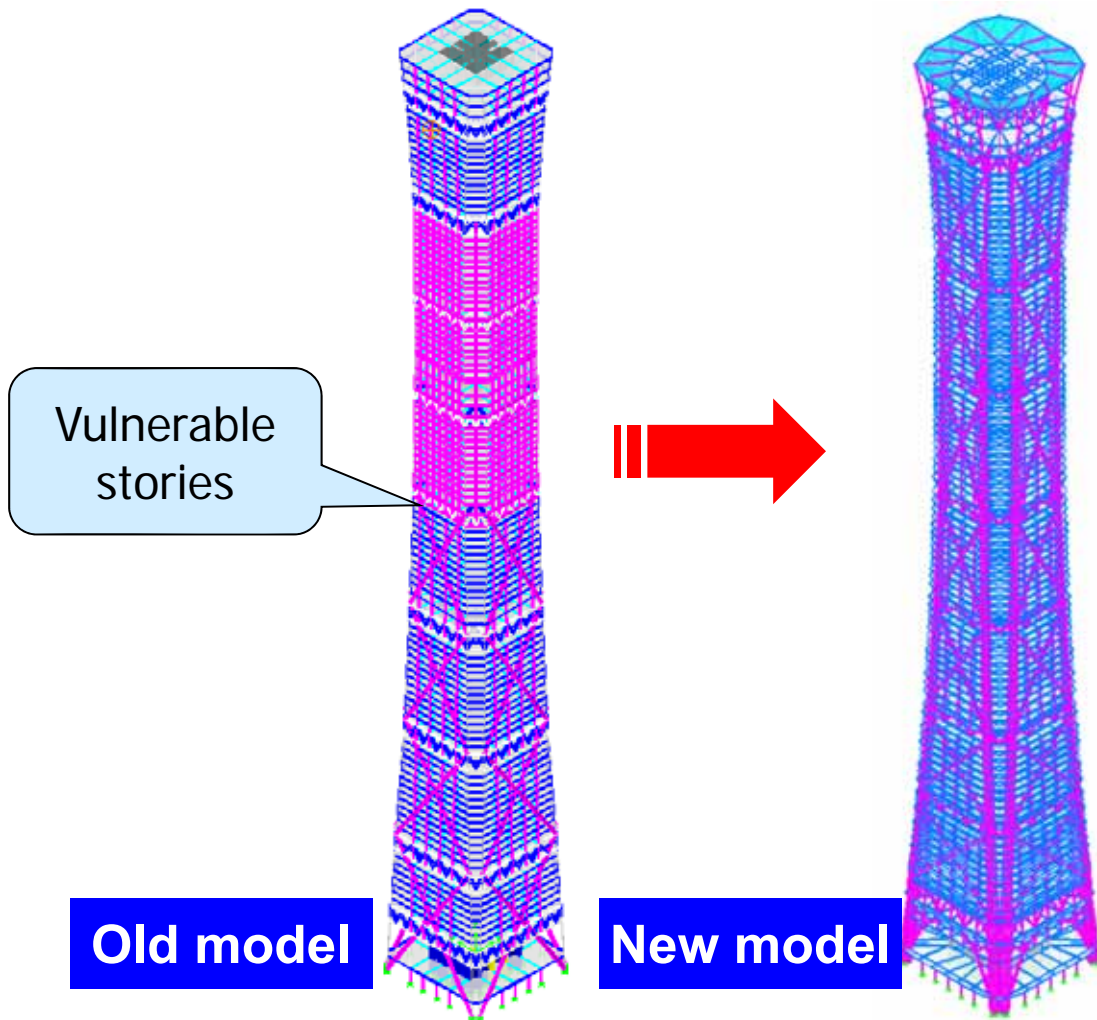

- Scenario simulation

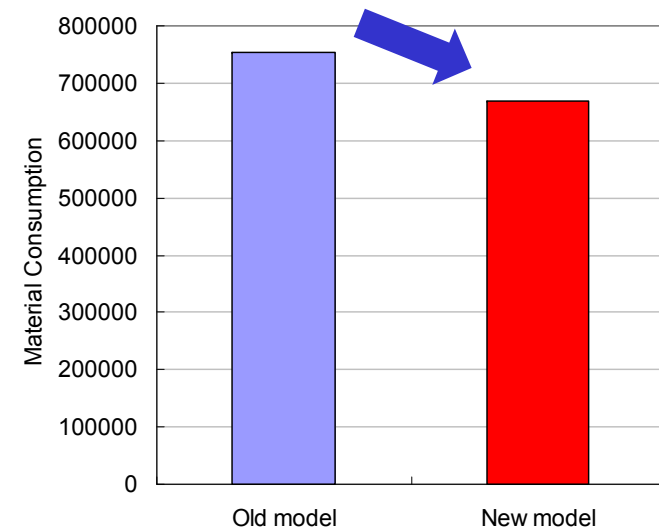

Design of the tallest building in Beijing

Proposed engineering solution

Collapse margin increased **15%**

Material consumption reduced **11%**
(84,338 ton)

Tsinghua University

Shanghai Tower (上海中心) H=632m

Design of Qiongzhou Strait Bridge

- Two design schemes

- Plan A: Total length=4304m / Main span=1500m

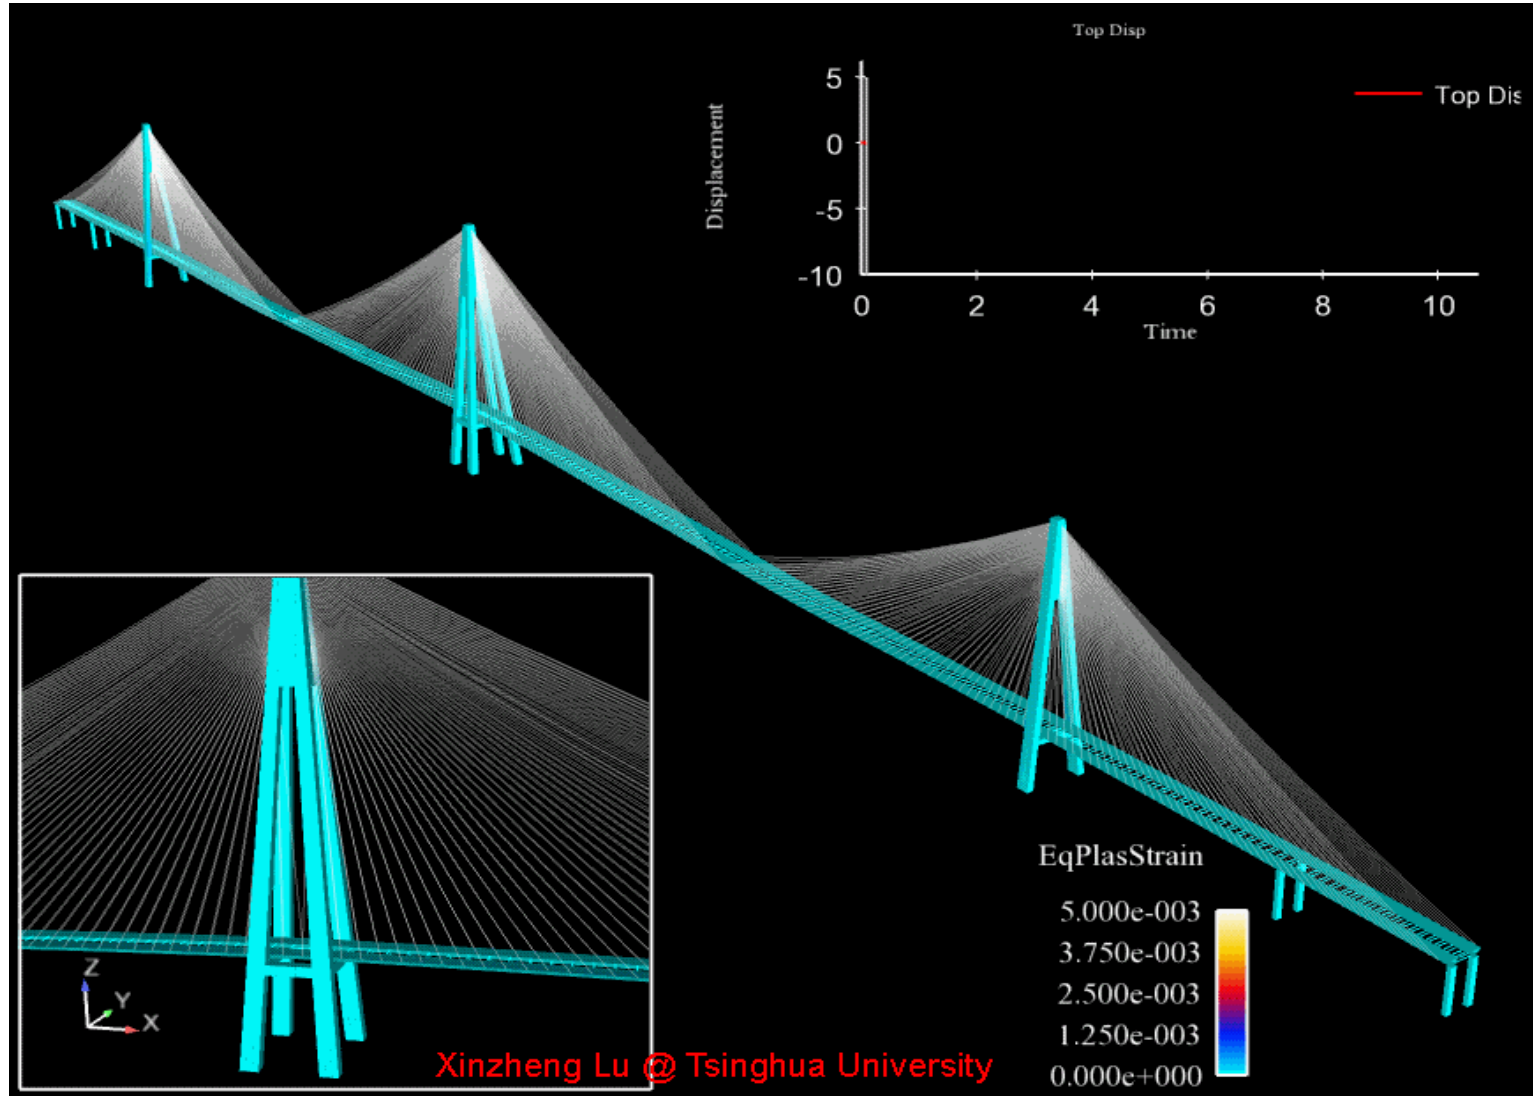

- Plan B: Total length=5400m / Main span=3000m

Design of Qiongzhou Strait Bridge

■ Scenario simulation

Design of Qiongzhou Strait Bridge

■ Proposed engineering solution

Plan	Hazards	Evaluation results (Risk)
Plan A Cable stayed bridge	Earthquake	16.05
	Ship collision	12.70
	Windstorm	...
Plan B Suspend bridge	Earthquake	22.62
	Ship collision	20.90
	Windstorm	...

Collision of high-speed train to buildings

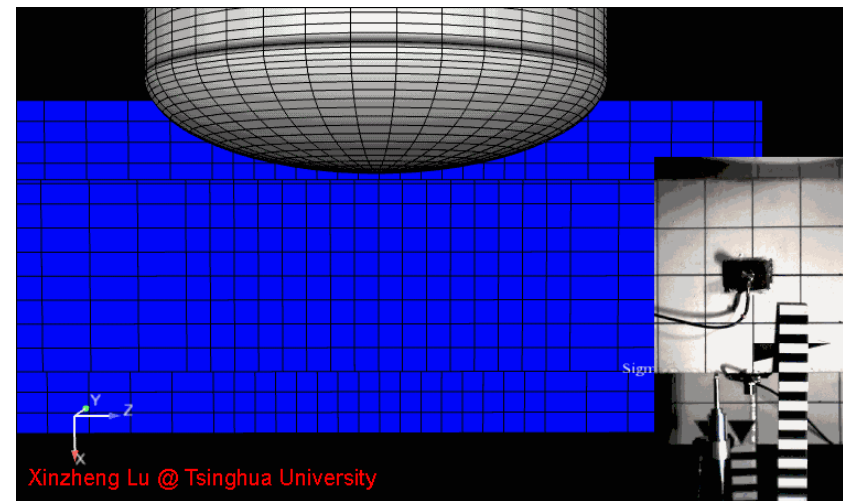

- China has the longest high-speed railway system in the world
- The speed of train passing the station is larger than 200km/h

Collision of high-speed train to buildings

- Numerical model and Experimental validation

Collision of high-speed train to buildings

- Scenario simulation

Collision of high-speed train to buildings

- Proposed engineering solution:
Collision-proof columns

Conventional columns

Collision-proof columns

Impact of airplane to NPP

1979 three mile island nuclear station

1986 Chernobyl Nuclear Power Plant

2011 Fukushima Nuclear Power Plant

From Purdue University

Impact of airplane to NPP

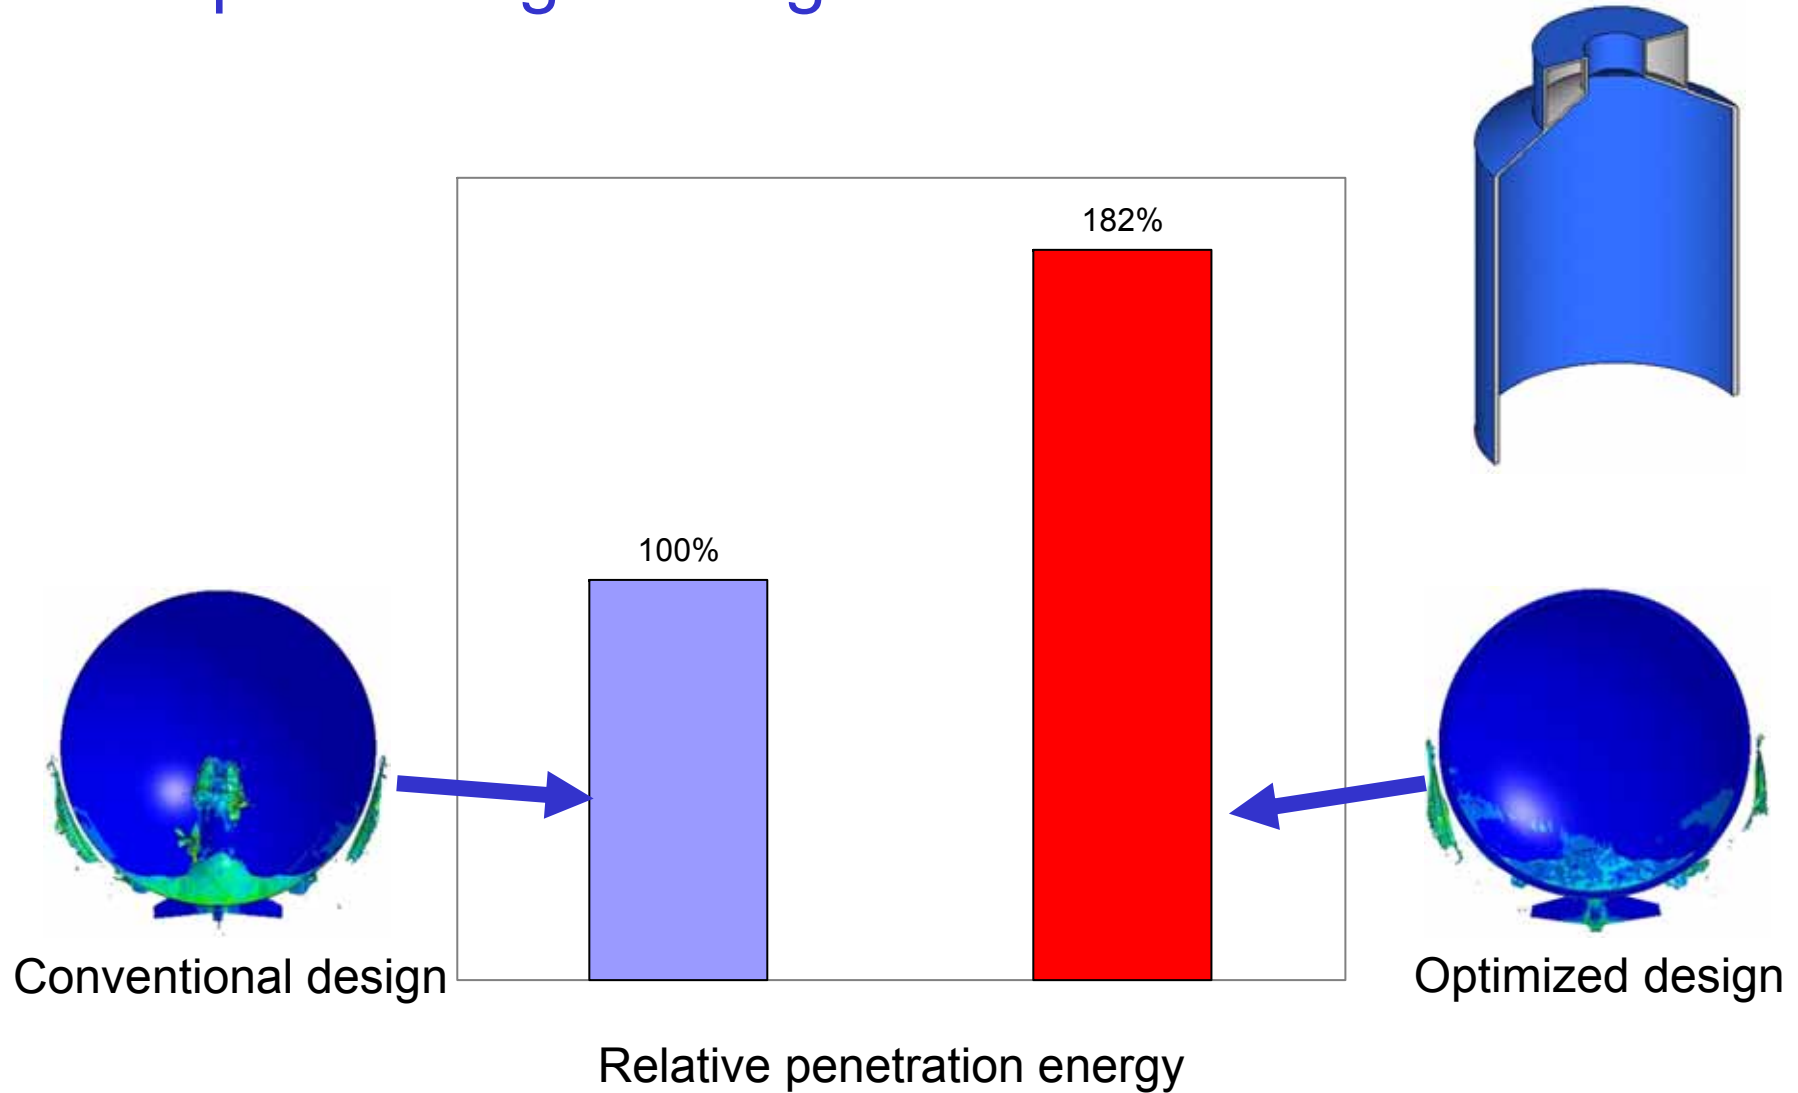

- Numerical model and scenario simulation

ost

Impact of airplane to NPP

- Proposed engineering solutions

Seismic disaster prediction for cities

Seismic disaster prediction for cities

- Numerical models

GIS

Computing model

Seismic disaster prediction for cities

■ Model validation

Refined FE model

Inter-story hysteretic model

Top displacement

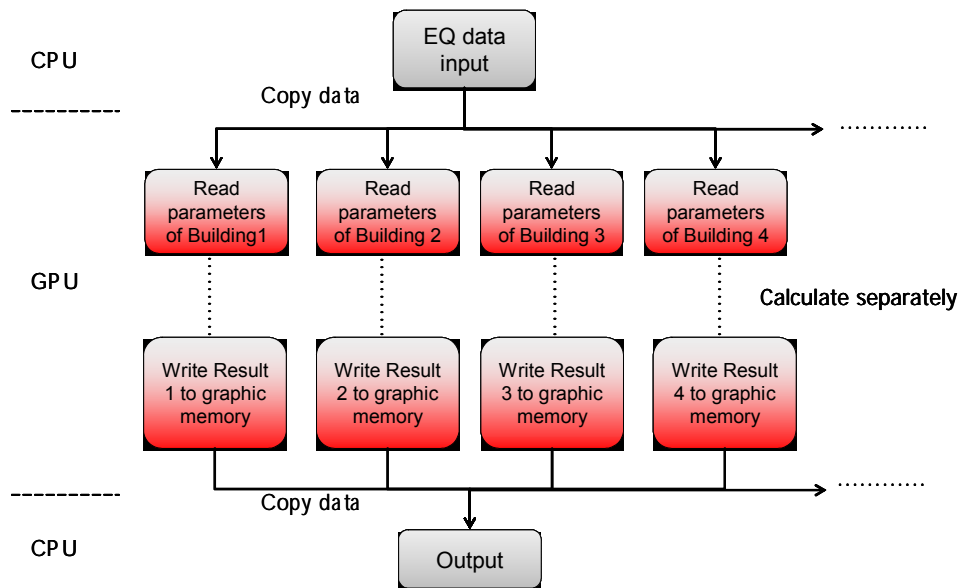

Inter-story drift

Seismic disaster prediction for cities

- GPU (Graphic Processing Unit) based high performance computing

39x of speedup

Seismic disaster prediction for cities

Seismic disaster prediction for cities

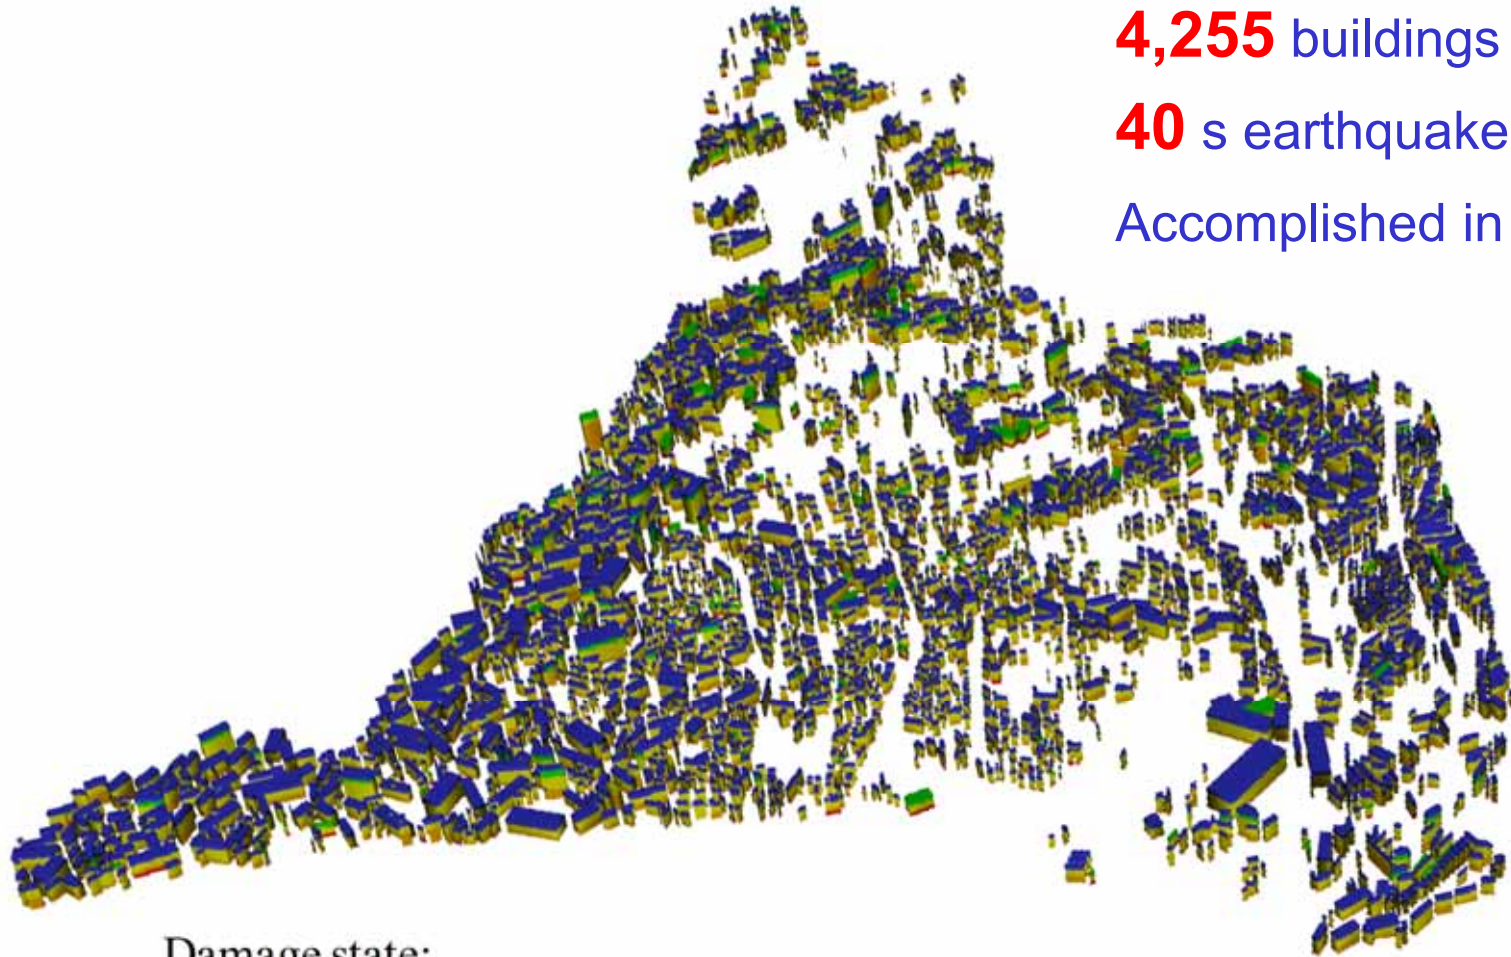

■ Scenario simulation

Desktop Computer

4,255 buildings

40 s earthquake simulation

Accomplished in **216** s

Damage state:

■ None ■ Slight ■ Moderate ■ Extensive ■ Complete

Seismic disaster prediction for cities

■ Scenario simulation

Desktop Computer

4,255 buildings

40 s earthquake simulation

Accomplished in **216** s

Damage state:

■ None ■ Slight ■ Moderate ■ Extensive ■ Complete

Seismic disaster prediction for cities

■ Scenario simulation

Experimental validation

Technology

Design methodology

Engineering

Computational algorithm

Mathematic

Conclusions

Scenario Simulation

Engineering Solution

Human resilience

Knowing what may happen, how to respond

Recovery government

Provide vision, leadership, service, information

Infrastructure resilience

Ability to return to full occupancy and function

Resilient community

Thank you for your attention!
